

Expected sensitivity vs. dataset size:

CMS inelastic dark matter search, displaced $\mu^+ \mu^- + p_T^{miss}$ (arXiv:2305.11649)

Run 3 good-for-physics luminosity estimated as 355 fb^{-1} delivered $\times$ 85% (Run 2 ratio). Statistical scaling only; the $\sim 5\text{--}10\%$ larger signal cross section at 13.6 TeV and any analysis improvements are not included (conservative).
